

US dollar-neutral Russell 1000 long/short equity. Multi-factor proprietary alpha, optimized against a 57-factor Barra-style risk model (50 industries + 7 styles). Monthly rebalance, ~11.8% one-sided turnover (% of NAV), ~2.0x gross, ~268 positions.

Headline statistics

Ann. Return (net, CAGR)	Ann. Vol	Sharpe (net, daily)	Max DD (daily)	Turnover (mo, 1-side, % NAV)	Avg Gross	Avg Net	Mkt Beta
7.9%	4.6%	1.66	-5.5%	11.8%	2.00x	0.007	+0.007

ALL FIGURES ARE QUOTED ON NAV (CAPITAL), NOT GMV. Gross market value runs ~2.0x NAV, so a GMV-quoted turnover or cost figure would be roughly half the number shown here. Returns are the pure long/short trading stream, zero-interest convention, net of modelled transaction costs and observed borrow (GC-filtered short book). Statistics daily-computed. Backtest 2010-2026 at \$50M initial capital, compounding. Book-of-record is cryptographically sealed and publicly timestamped; every figure here is derived from it at render time.

Constraints at rebalance

Constraint	Limit
Gross exposure	2.00x
Net exposure	dollar-neutral
Position size	±1.00% of NAV
Minimum position	0.05% of NAV
Industry net	±2.50%
Industry gross	≤ 15.0%
Sector net	±5.0%

Constraint	Limit
Sector gross	≤ 30%
Style loadings	±0.10
Market beta	±0.10
Turnover	10% per side
Ex-ante volatility	5% target
Short book	real borrow ≤ 1%

86% of return variance is unexplained by the style factors; residual alpha is 6.8%/yr at t=6.4.

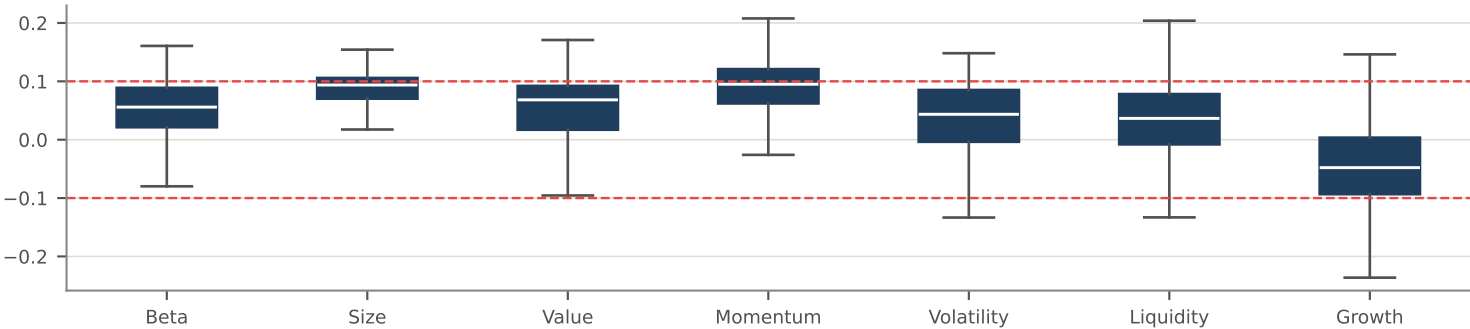

Regression	Value
Alpha (ann.)	6.8%
Alpha t-stat	6.4
R²	14.4%
Unexplained	86%
Corr. to Mkt	+0.03

The book targets style loadings within ±0.20. The optimizer therefore constrains them to ±0.10 at each rebalance to account for intra rebalance market drift. Rebalance: monthly, and on any gross breach below 1.8x or above 2.2x.

Style exposures and return correlation

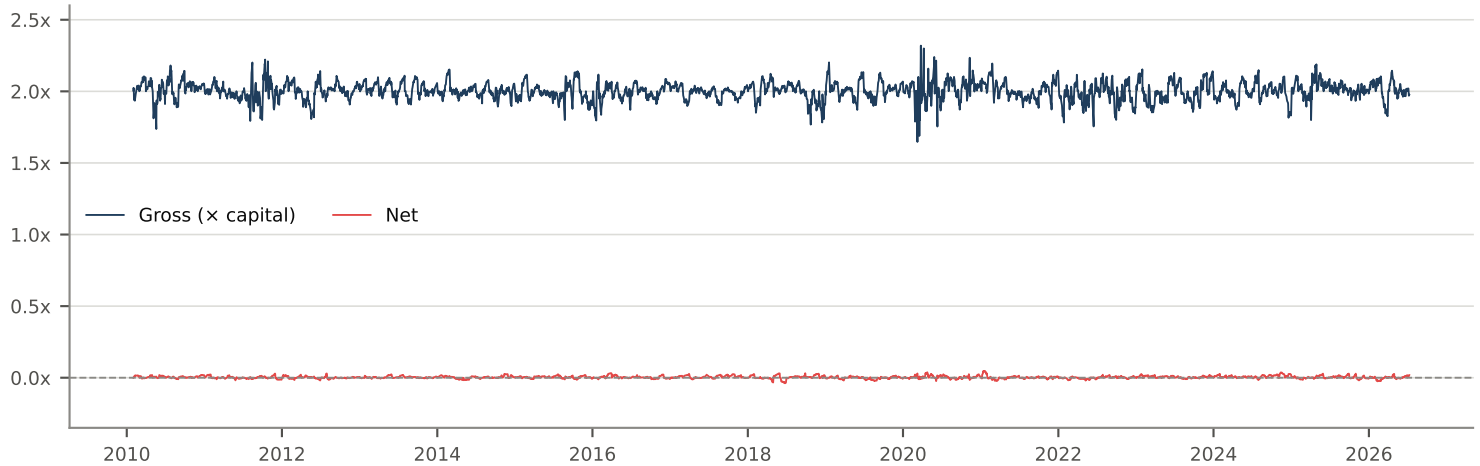

Style	Cap	Avg exposure	p95 exposure
Beta	±0.10	+0.050	0.117
Size	±0.10	+0.085	0.124
Value	±0.10	+0.051	0.114
Momentum	±0.10	+0.088	0.158
Volatility	±0.10	+0.037	0.110
Liquidity	±0.10	+0.033	0.133
Growth	±0.10	-0.041	0.152

Realized style exposures vs the ±0.10 constraint (daily, whole history)

ALL FIGURES ARE QUOTED ON NAV (CAPITAL), NOT GMV. Gross market value runs ~2.0x NAV, so a GMV-quoted turnover or cost figure would be roughly half the number shown here. Returns are the pure long/short trading stream, zero-interest convention, net of modelled transaction costs and observed borrow (GC-filtered short book). Statistics daily-computed. Backtest 2010-2026 at \$50M initial capital, compounding. Book-of-record is cryptographically sealed and publicly timestamped; every figure here is derived from it at render time.

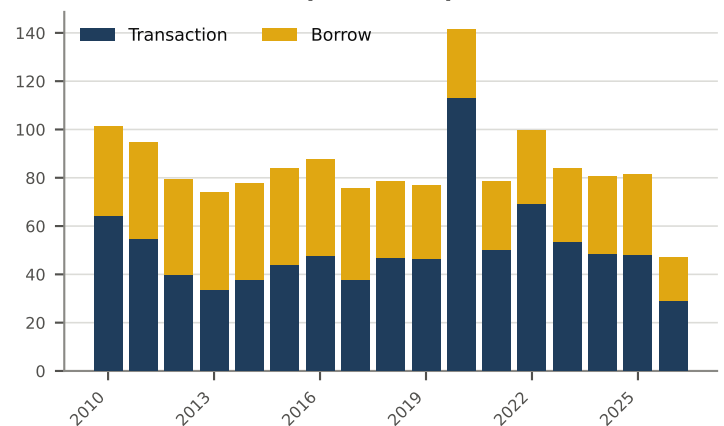

Gross and net exposure — 2.0x gross held for 16 years, net pinned at zero

Sharpe bridge — what the costs actually take

Stage	Sharpe
Gross	1.84
Net of t-costs	1.73
Net of t-costs + borrow	1.66

Annual cost decomposition (bps of NAV)

Top-5 drawdowns

Depth	Start	Trough	Recovered	Length
